TAU Performance System

- TAU supports both sampling and direct instrumentation
- Memory debugging as well as I/O performance evaluation
- Profiling as well as tracing
- Interfaces with Score-P for more efficient measurements
- TAU's instrumentation covers:
 - Runtime library interposition (`tau_exec`)
 - Compiler-based instrumentation
 - PDT based Source level instrumentation: routine & loop
 - Event based sampling (`TAU_SAMPLING=1` or `tau_exec -ebs`)
 - Callstack unwinding with sampling (`TAU_EBS_UNWIND=1`)
 - OpenMP Tools Interface (OMPT, `tau_exec -T ompt`)
 - CUDA CUPTI, OpenCL (`tau_exec -T cupti -cupti`)

Application Performance Engineering using TAU

- How much time is spent in each application routine and outer *loops*? Within loops, what is the contribution of each *statement*? What is the time spent in OpenMP loops?
- How many instructions are executed in these code regions?
Floating point, Level 1 and 2 *data cache misses*, hits, branches taken? What is the extent of vectorization for loops on Intel MIC?
- What is the memory usage of the code? When and where is memory allocated/de-allocated? Are there any memory leaks? What is the memory footprint of the application? What is the memory high water mark?
- How much energy does the application use in Joules? What is the peak power usage?
- What are the I/O characteristics of the code? What is the peak read and write *bandwidth* of individual calls, total volume?
- What is the contribution of each *phase* of the program? What is the time wasted/spent waiting for collectives, and I/O operations in Initialization, Computation, I/O phases?
- How does the application *scale*? What is the efficiency, runtime breakdown of performance across different core counts?

Using TAU

- TAU supports several compilers, measurement, and thread options

Intel compilers, profiling with hardware counters using PAPI, MPI library, CUDA...

Each measurement configuration of TAU corresponds to a unique stub makefile (configuration file) and library that is generated when you configure it

- To instrument source code automatically using PDT

Choose an appropriate TAU stub makefile in <arch>/lib:

```
% module load tau
```

```
% export TAU_MAKEFILE=$TAU/Makefile.tau-icpc-papi-mpi-pdt-openmp-opari
```

```
% export TAU_OPTIONS='-optVerbose ...' (see tau_compiler.sh )
```

Use tau_f90.sh, tau_cxx.sh, tau_upc.sh, or tau_cc.sh as F90, C++, UPC, or C compilers respectively:

```
% mpif90 foo.f90      changes to
```

```
% tau_f90.sh foo.f90
```

- Set runtime environment variables, execute application and analyze performance data:

```
% pprof (for text based profile display)
```

```
% paraprof (for GUI)
```

Installing and Configuring TAU

■ Installing PDT:

Compiling Fortran Codes with TAU

- If your Fortran code uses free format in .f files (fixed is default for .f), you may use:
`% export TAU_OPTIONS= '-optPdtF95Opts="-R free" -optVerbose '`
- To use the compiler based instrumentation instead of PDT (source-based):
`% export TAU_OPTIONS= '-optComplnst -optVerbose'`
- If your Fortran code uses C preprocessor directives (`#include`, `#ifdef`, `#endif`):
`% export TAU_OPTIONS= '-optPreProcess -optVerbose -optDetectMemoryLeaks'`
- To use an instrumentation specification file:
`% export TAU_OPTIONS= '-optTauSelectFile=select.tau -optVerbose -optPreProcess'`
`% cat select.tau`
`BEGIN_INSTRUMENT_SECTION`
`loops routine="#"`
`# this statement instruments all outer loops in all routines. # is wildcard as well as comment in first column.`

NPB-MZ-MPI / BT (Block Tridiagonal Solver)

- What does it do?
 - Solves a discretized version of the unsteady, compressible Navier-Stokes equations in three spatial dimensions
 - Performs 200 time-steps on a regular 3-dimensional grid
- Implemented in 20 or so Fortran77 source modules
- Uses MPI & OpenMP in combination
 - 30 processes each with 4 threads should be reasonable
 - bt-mz_B.30 should take around 40 seconds

TAU Source Instrumentation

- Edit `config/make.def` to adjust build configuration
 - Uncomment specification of compiler/linker: `MPIF77 = tau_f90.sh`
 - Make clean and build new tool-specific executable

```
% make clean
% make bt-mz CLASS=B NPROCS=8
Built executable ../bin.tau/bt-mz_B.8
```

- OR use `make MPIF77=tau_f90.sh suite` on the command line
- Change to the directory containing the new executable before running it with the desired tool configuration

```
% cd bin.tau
% cp ../jobscript/darwin/bt-mz.job .

tau_exec

```
$ tau_exec
```

```
Usage: tau_exec [options] [--] <exe> <exe options>
```

Options:

```
-v          Verbose mode

-io         Track I/O
-memory     Track memory allocation/deallocation
-memory_debug Enable memory debugger
-cuda       Track GPU events via CUDA
-cupti      Track GPU events via CUPTI (Also see env. variable TAU_CUPTI_API)
-openccl    Track GPU events via OpenCL
-openacc    Track GPU events via OpenACC (currently PGI only)
-ompt       Track OpenMP events via OMPT interface
-armci      Track ARMCI events via PARMCI

-loadlib=<file.so> : Specify additional load library
-XrunTAUsh-<options> : Specify TAU library directly
-gdb        Run program in the gdb debugger
```

Notes:

```
Defaults if unspecified: -T MPI
MPI is assumed unless SERIAL is specified
```

- Tau_exec preloads the TAU wrapper libraries and performs measurements.

No need to recompile the application!

tau_exec Example (continued)

Example:

```
mpirun -np 2 tau_exec -T icpc,ompt,mpi -ompt ./a.out
```

```
mpirun -np 2 tau_exec -io ./a.out
```

Example - event-based sampling with samples taken every 1,000,000 FP instructions

```
mpirun -np 8 tau_exec -ebs -ebs_period=1000000 -ebs_source=PAPI_FP_INS ./ring
```

Examples - GPU:

```
tau_exec -T serial,cupti -cupti ./matmult (Preferred for CUDA 4.1 or later)
```

```
tau_exec -openacc ./a.out
```

```
tau_exec -T serial -opencl ./a.out (OPENCL)
```

```
mpirun -np 2 tau_exec -T mpi,cupti,papi -cupti -um ./a.out (Unified Virtual Memory in CUDA 6.0+)
```

qsub mode (IBM BG/Q only):

Original:

```
qsub -n 1 --mode smp -t 10 ./a.out
```

With TAU:

```
tau_exec -qsub -io -memory -- qsub -n 1 ... -t 10 ./a.out
```

Memory Debugging:

-memory option:

Tracks heap allocation/deallocation and memory leaks.

-memory_debug option:

Detects memory leaks, checks for invalid alignment, and checks for array overflow. This is exactly like setting TAU_TRACK_MEMORY_LEAKS=1 and TAU_MEMDBG_PROTECT_ABOVE=1 and running with -memory

- tau_exec can enable event based sampling while launching the executable using the **-ebs** flag!
- On stampede, you need to put perl-mic/bin in your path
- ibrun.symm -m test.sh
- Within test.sh call tau_exec -T ompt

Using tau_exec

- Edit bt-mz.job to use:
- module load tau
- application="tau_exec -T impi,latest,ompt,mpi,papi,pdt -ompt ./bt-mz_B.8"

```
% vi bt-mz.job  
module use tau  
application="tau_exec -T impi,latest,ompt,mpi,papi,pdt -ompt ./bt-mz_B.8"
```

- OR copy the job script

```
% cd bin  
% cp ../jobscript/bt-mz.tau_exec.job .  
% sbatch bt-mz.tau_exec.job
```

- You may also add -ebs flag later for a subsequent run to see line level information.
- In this case, there is no change to the source code, build system and tau_exec operates on an uninstrumented binary.

The screenshot displays the TAU: ParaProf Manager application window. The interface includes a menu bar with 'File', 'Options', and 'Help'. On the left, a tree view shows the hierarchy: Applications > Standard Applications > Default App > Default Exp > profile.cubex. Under 'profile.cubex', a list of metrics is shown, with 'Time' selected. The right pane contains a table with two columns: 'MetricField' and 'Value'. The table lists several fields with their corresponding values. At the bottom, there is an 'Expression' input field containing the formula '"PAPI_FP_INS"/"Time"', a 'Clear' button, and a row of arithmetic operators (+, -, *, /, =, {, }) followed by an 'Apply' button.
